

Eastboard Consoles

PROJECT SUMMARY

AMV ALL MOBILE VIDEO
 "TITAN" Production Truck

The Production area of the truck includes an ultra-lightweight forward console with plastic honeycomb worksurfaces and a reversible bolster at the switcher frame made from wet-suit material. The two rear consoles each have three built-in, independently controlled one-bay LCD monitor lifts, built from space-age aluminum-polymer composites. Each console moves on roller-bearing tracks in the floor for travel; the legs fold inward, the worksurface folds down, and the units are tracked back & locked into closed position. The rear consoles feature lightweight PVC doors, and blue LED accent lighting over silver and black Kydex end panels.

The Tape area (below) includes this track-mounted console with two built-in two-bay LCD monitor lifts. In operating position, the worksurface joins with the EIC desk, to form a continuous work area. There's also a matching rack-mount forward console. All bullnose edges are beveled and finished with silver automotive lacquer.

In Audio, the forward overbridge supports CRTs & LCDs, and incorporates underside lighting to illuminate the audio board. The rear console is track-mounted and includes three rear-facing sloped equipment bays, each with LCD task lighting.

The TITAN Production Truck won the Technical Innovation Award at NAB2006.
